

Harbour Retail — Junior Data Analyst Demo JD

Junior Data Analyst

Company: Harbour Retail

Location: Sydney, NSW

Employment Type: Full-time

Experience Level: Entry Level / Junior

Team: Data & Analytics

About Harbour Retail

Harbour Retail is a growing Sydney-based e-commerce startup using data to improve customer acquisition, digital shopping experiences and commercial performance.

As the business grows, we are looking for a Junior Data Analyst to support the team in turning website marketing and sales data into clear insights that help teams make better decisions.

You will work with members of the Data, Marketing and Commercial teams and will be supported by more experienced analysts. This role is suited to a recent graduate or early-career analyst who enjoys working with data, investigating business questions and communicating findings clearly.

About the Role

As a Junior Data Analyst, you will help collect, validate, analyses and interpret business data across website traffic, marketing channels and online sales.

Your work will include routine reporting as well as ad hoc investigations into changes in business performance.

A key part of the role is not only calculating metrics, but understanding what those metrics mean, identifying when further evidence is required, and communicating findings to non-technical stakeholders.

Key Responsibilities

Data Preparation and Quality

- Collect, organize and validate data from sales, website and marketing sources.
- Check datasets for missing values, inconsistencies and obvious data-quality issues.
- Maintain clear documentation of data sources, calculations and analytical assumptions.
- Support reliable and consistent reporting across business teams.

SQL and Data Analysis

- Write basic SQL queries to extract, filter, group and summaries business data.
- Use aggregation techniques to analyses performance across products, time periods and acquisition channels.
- Calculate and monitor key business metrics such as website traffic, orders and conversion rates.
- Compare results across periods or customer/channel segments to identify meaningful changes.

Business Analysis and Problem Solving

- Investigate changes in business performance and identify possible explanations supported by available data.
- Distinguish between what the data directly shows and what remains uncertain.
- Identify when additional data is required before reaching a business conclusion.
- Perform ad hoc analysis to support questions raised by Marketing, Product or Commercial teams.
- Translate analytical findings into practical next steps or recommendations where the available evidence supports them.

Reporting and Visualization

- Assist in creating recurring reports, tables and dashboards using Excel or business-intelligence tools.
- Present metrics and analytical findings in a clear, structured and accessible format.
- Support the development of simple visualizations that help stakeholders understand trends and performance.

Stakeholder Communication

- Explain analytical findings clearly to colleagues who may not have a technical background.
- Summaries the business implications of an analysis rather than only presenting calculations.
- Clearly communicate assumptions, limitations and areas where further investigation is required.
- Collaborate with cross-functional teams to understand business questions and data requirements.

Skills and Experience

Essential

- Bachelor's degree, or near completion, in Data Analytics, Business Analytics, Statistics, Mathematics, Computer Science, Economics or a related discipline.
- Foundational knowledge of SQL, including filtering, grouping and basic aggregation.
- Strong Excel or spreadsheet skills.
- Ability to calculate and interpret basic business metrics.
- Strong analytical and structured problem-solving skills.
- High attention to detail and commitment to data accuracy.
- Ability to explain analytical findings clearly in written and verbal form.
- Willingness to learn and work in a fast-moving startup environment.

Desirable

- Internship, university project or portfolio experience involving data analysis.
- Familiarity with Python or R.
- Exposure to Power BI, Tableau or another data-visualization platform.
- Basic understanding of digital analytics, e-commerce or marketing performance metrics.
- Experience presenting analytical work to non-technical audiences.

What Good Looks Like in This Role

A successful Junior Data Analyst does more than produce correct calculations.

You should be able to:

- identify the right metric for a business question;
- analyses data accurately;
- recognize when a conclusion is or is not supported by the available evidence;
- explain your reasoning clearly;
- identify what additional information may be required; and
- turn analysis into a sensible next step for the business.

Example Business Questions You May Work On

- Why has website conversion changed even though traffic has increased?
- Which acquisition channels appear to be driving changes in customer behavior?

- Does the available evidence support changing marketing investment?
- What additional information would be needed before recommending a commercial action?
- How should an analytical finding be explained to a Marketing Manager or other non-technical stakeholder?

Tools

You may work with:

- SQL
- Microsoft Excel / Google Sheets
- Power BI or similar BI tools
- Basic Python or R where appropriate
- Website, marketing and sales datasets

What We Value

We value candidates who are curious, evidence-driven and comfortable saying when the available data is not sufficient to support a conclusion.

For a junior role, we do not expect you to know everything. We are interested in how you approach a problem, how carefully you work with evidence, and how clearly you explain your reasoning.
